GRANITE

Granite began its life as liquid magma within the earth's core. Granite is a hard, crystalline, ingenious rock formed from ex- treme heat, comprised of various minerals such as quartz and feldspar. Dimensional granite specifications include high load bearing capacity, flexibility of cutting, ability to yield thin and large slabs and above all durability. Granite is a very strong and du- rable stone. It takes heavy gloss polish, popularly used as architectural stone for interior and exterior walls, floors and mon- umental stone.
